

**AMENDMENT NO. 2 MAY 2002
TO
IS 2521 : 1984 SPECIFICATION FOR MAGNESIUM
STEARATE FOR COSMETIC INDUSTRY
(Second Revision)**

(Page 6, clause A-3.2) — Substitute the following for the existing:

A-3.2 Procedure — Heat 50 g of the material into a clean beaker with 400 ml of water and 50 ml of dilute sulphuric acid until the fatty acids have separated as a clean layer on the top (if there is an emulsion, add 2-3 g Sodium chloride and mix well). Transfer in a separating funnel and wash the fatty acids with boiling water by swirling the contents until free of sulphate (test with lead acetate solution). Filter the fatty acids through a filter paper fitted in a funnel and collect in a conical flask. This filtration should be conducted in hot condition either using hot water jacketed funnel or keeping the set of funnel fitted with filter paper and conical funnel into an oven which is maintained at around 70-80 °C. After filtration is over, dry the acids for 20 minutes at 100 °C. These fatty acids are also used for test in A-9. Determine the titre as directed in IS 286 : 1978.
